

7 Stocks for the Coming Quantum Boom

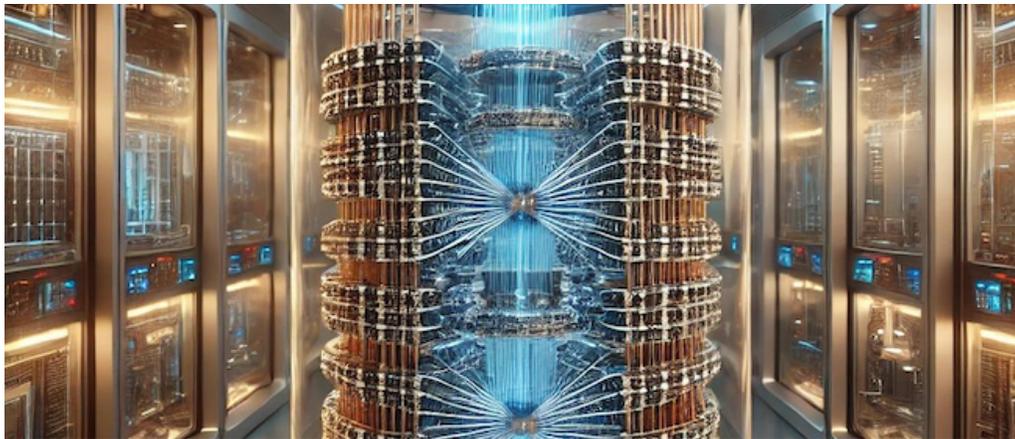

This new tech could make the AI revolution look small

Andrea J.

Investing

March 14, 2026

Imagine being early on AI.

Before ChatGPT... before the headlines... before Wall Street cared.

That was 2016.

We hosted a private event for Fool members and gave away a single stock recommendation: **Nvidia**.

Today, we believe we've found the next tech shift with that kind of world-altering potential.

This time, it's quantum computing.

And what excites our analysts so much is this isn't a tech upgrade; it's a complete rewrite of how information is processed, and what problems can even be solved.

And consider this: Quantum is projected to unlock \$700 billion in value by 2035.

If you earned **\$1 million per day** starting from the time Christopher Columbus first landed in the Americas in 1492, you'd have only about **\$193 billion** today. That means, that even after more than 500 years of earning a million dollars every single day, you'd still be half a trillion dollars short of the projected value of this industry by 2035.

We're talking about something **set to transform industries across the board**—healthcare, finance, cybersecurity—and turn the tech world upside down.

And right now, it's at **Tier ZERO**: The phase where it is just beginning... a rare opportunity to get in on the ground floor before the world fully understands what's coming.

Tier ZERO opportunities don't come around often, but they are a bit of our specialty. Beyond telling members to buy Nvidia for AI in 2016... we've also:

- Told members to buy Netflix, back in 2004, when most of the world was still visiting Blockbuster (now up **51,300%**).
- Urged members to buy a little-known online shopping site called Amazon as early as 1997, and again in 2002.
- Before electric vehicles were a common sight on the road, we told members to buy Tesla in 2012 (up **18,330%**).

And now, we've uncovered the **next Tier ZERO technology** that's flying under the radar—but not for much longer... especially now that the government has enacted a federal initiative to grow this technology fast.

It's a technology that sounds like something out of science fiction, but it's already being put into practice by some of the world's leading companies like **Google, IBM, and Microsoft**, just to name a few.

And here's where it gets really interesting. We've put together a one-of-a-kind report that explains exactly what quantum computing is, how it could revolutionize industries, and, most importantly, which **7 stocks we believe are best positioned to benefit as this technology grows and expands.**

At Tier ZERO, the opportunity is enormous, but there are always risks involved with early-stage investing. That's why we've carefully selected companies that aren't just chasing the quantum dream, but also have strong foundations in other lucrative sectors. These are companies that will benefit from the rise of quantum computing—but won't leave you hanging if it takes a little longer to reach its full potential.

We've been cleared to offer a 50% special new member discount for anyone reading this message — meaning you can get started with *Stock Advisor*, and get everything inside, for 50% off your first year...

And you'll get **instant access** to our exclusive report on the 7 quantum computing stocks we think will help change the world.

Simply click below to claim your discount and get in on Tier ZERO before everyone else catches on.
